Write appropriate CSS for 1997 to center and add pink borders to a set of profile images on a website.

To center and add pink borders to a set of profile images on a website using CSS, you can use the following code:

css   Copy code

```
<style> /* CSS for 1997 */ .profile-images-
container { display: flex; justify-content:
center; } .profile-image { border: 2px solid
pink; margin: 10px; padding: 10px; } </style>
```

In your HTML markup, you would need to wrap the profile images in a container element with the class **profile-images-container**, and each individual profile image should have the class **profile-image**. Here's an example of how your HTML could look:

html   Copy code

```
<div class="profile-images-container"> <img
src="profile1.jpg" alt="Profile 1"
class="profile-image"> <img src="profile2.jpg"
alt="Profile 2" class="profile-image"> <img
src="profile3.jpg" alt="Profile 3"
class="profile-image"> <!-- Add more profile
images as needed --> </div>
```

Make sure to adjust the image URLs and alt text according to your actual profile images.

Write a simpler version of this that just centers the images and fixes them to a width of 300, with a border.

Certainly! Here's a simpler version of the CSS code that centers the images, fixes their width to 300 pixels, and adds a border:

css   Copy code

```
<style> /* CSS for centering images with a
fixed width and border */ .profile-images-
container { display: flex; justify-content:
center; } .profile-image { width: 300px;
border: 2px solid pink; } </style>
```

In your HTML markup, you can use the same structure as before, with the `profile-images-container` container and `profile-image` class for each image:

html   Copy code

```
<div class="profile-images-container"> <img
src="profile1.jpg" alt="Profile 1"
class="profile-image"> <img src="profile2.jpg"
alt="Profile 2" class="profile-image"> <img
src="profile3.jpg" alt="Profile 3"
class="profile-image"> <!-- Add more profile
images as needed --> </div>
```

This will center the images horizontally and apply a 300-pixel width to each image with a pink border. Adjust the image URLs and alt text according to your specific images.

Rewrite this without using the container, for a single profile image.

If you want to center and fix the width of a single profile image without using a container, you can achieve that by applying CSS directly to the image element itself. Here's an example:

```css
<style> /* CSS for centering a single profile
image with a fixed width and border */
.profile-image { display: block; margin: 0
auto; width: 300px; border: 2px solid pink; }
</style>
```

In your HTML markup, you can simply use the **profile-image** class for the image element:

```html
<img src="profile.jpg" alt="Profile"
class="profile-image">
```

This will center the profile image horizontally, give it a fixed width of 300 pixels, and apply a pink border. Adjust the image URL and alt text accordingly.
